

NATURAL GAS AND WATER TRANSFER COMPANY REDUCES SPILLS, LOST-TIME, AND COST OVERRUNS WITH JOE KNOWS

THE CLIENT

Our client is a leader in the natural gas, oil, and water transfer industry with over 450 employees. The company maintains assets consisting of over 2,500 miles of pipelines producing methane, conventional, and unconventional oil and gas through 4,400 net producing gas wells as well as over 300 miles of water pipeline.

THE PROBLEM

The company had success in running their business model with proprietary methods of finding and sourcing inspectors for years. For many years, the model worked well. A few years ago, the client experienced inspection issues that changed that.

During that year, the company experienced increases in safety and lost-time incidents, environmental issues, and cost management. Ten spills in one year and budget overruns of over 30% led the company to seek a new and innovative solution fast.

THE SOLUTION

The company sought out partners who closely aligned with their mission, vision, and culture to work with them on correcting the issues at hand. We worked to implement our **High-Performance Program** to elevate their safety and quality culture. Our team recruited inspectors with a commitment to quality and safety who were aligned with the culture of the client. These inspectors were able to improve the quality control at the client's sites.

RESULTS

As a result of our relationship with the client, we were able to help the client optimize their safety, quality, and environmental safety culture to address their core issues. Lost-time accidents decreased from 3 incidents in one year to 1 incident in the following year. Spills decreased from 10 in one year to 5 in the following year. Spending went from 30-35% above budget to within 0.5% of planned budget in the following year. We've been partnering with this client for two years and are looking forward to increased results as our relationship continues.
